

COMBINING NARROWBAND APPLICATIONS WITH BROADBAND TRANSPORT

ABSTRACT

10022341 121201
The combination of a narrowband application that provides a narrowband resource with broadband transport is enabled with a temporary connection across the broadband network between the narrowband resource device in a legacy switch and a Media Gateway within the broadband network. 5 The Media Gateway has an established call connection to a called subscriber for the call. While providing the resource, the call connection for the call in the Media Gateway is broken, and the temporary connection is used.
